## Government data-driven decision-making (DDDM) framework implementation. Test case: crisis management

Deliverable 3.1: Estonian (municipality) risk report

Funded by the European Union

This document was produced with the financial assistance of the European Union. Its content is the sole responsibility of the author(s). The views expressed herein can in no way be taken to reflect the official opinion of the European Union.

The project is funded by the European Union via the Technical Support Instrument, managed by the European Commission Directorate-General for Structural Reform Support.

This report has been delivered in June 2022, under the EC Contract No. REFORM/SC2021/076. lt has been delivered as part of the project "Government data-driven decision-making (DDDM) framework implementation. Test case: crisis management".

#### Project 21EE02 GOVERNMENT DATA-DRIVEN DECISION-MAKING (DDDM) FRAMEWORK IMPLEMENTATION TEST CASE: CRISIS MANAGEMENT

### Output 3

# OECD's recommendations for the implementation of the redesigned DDDM framework, including in crisis management.

This document has been produced by the OECD under the leadership of the Digital Government and Data Unit (Open and Innovative Government Division, Directorate for Public Governance) and the Risk Governance Unit (Governance Reviews and Partnerships Division, Directorate for Public Governance).

## Background

1. This document is part of third Output (**Output 3**) that results from the activities implemented by the OECD in the context of the European Commission's (EC) Technical Support Instrument (TSI) Project 21EE02 Government Data-Driven Decision-Making (Dddm) Framework Implementation. Test Case: Crisis Management (hereinafter "the Project").

2. This Output 3 is framed in the context of the Outcomes, Outputs, and Activities described in the Project's final Detailed Project Description (DPD) endorsed by the EC Directorate General for Structural Reform Support (DG REFORM) on 18 May, 2022.

3. As described in the DPD, this document provides key OECD's recommendations for the implementation of the redesigned DDDM framework (including in crisis management) within the Project timeframe. As such, the recommendations aim to support for the implementation of the reform in line with OECD best practices and OECD frameworks in the areas of digital government, data-driven public sector, and crisis management.

4. This document mainly results from the implementation of this Project's Activity 9 under Output 3 by the OECD (see Figure 1):

Activity 9: Organisation of events for the cross-governmental dissemination of relevant larger reform project results to the Estonian government and the OECD's recommendations for the implementation of the redesigned DDDM framework (including in crisis management) within the Project timeframe. The overall reform project's success depends greatly on the communication of its results, as well as on the understanding and acceptance of the recommendations not only by the Government Office of the Republic of Estonia but also by the stakeholders. For this purpose, the OECD will organise cross-governmental dissemination events with relevant stakeholders from the Estonian public sector to share the results from the overall reform project that are available at that time and relate the OECD is technical assistance described in this Project. These events will also be an opportunity for the OECD to present its recommendations for the implementation of the reform, to disseminate best practices and OECD frameworks in the areas of digital government and data-driven public sector, and crisis management. The OECD will share relevant information on reform results that may have yielded from this Project and will communicate it in a way that is both understandable and relevant. To this effect, the media used for this dissemination is at the full discretion of the OECD and will be discussed with Estonia.

#### Figure 1. Project 21EE02: Outcomes, Outputs and Activities

Project 21EE02: Outputs and activities

Output 1:. Report providing recommendations on the strategy governance of the larger reform project.

Activity 1: Identification of strategic governance procedures, roles and responsibilities of different governance stakeholders.

Activity 2: Provide expert advice to support specific deliverables to be produced by the external contractor, namely on the definition of the To-be situation for both Outcome 1 and Outcome 2.

**Activity 3:** Advisory involvement in the larger reform project's advisory group (through the coordination mechanism groups that are defined and organised by the external contractor).

Activity 4: Support the organisation of strategic steering groups of the larger reform project (to be organised by the external contractor hired by DG Reform)

Activity 5: Support the assessment of the alternatives to improve the DDDM processes in general, and for crisis management and the re-design of the risk mapping and disaster loss data collection. The OECD will participate in the two operational groups for Outcome 1 and Outcome 2 put in place by the external contractor in the context of Estonia's wider project.

Activity 6: Coordinate with the external contractor to support the crossgovernmental capacity building actions and the assessment of the effectiveness of the proposed methodological guidelines, action plans, and roadmaps to be developed by the external contractor. Output 2. Guidelines and recommendations on the DDDM and crisis management areas covered by the larger reform project, in the form of a compilation document of the review of the key deliverables produced by the external contractor to provide recommendations on areas covered by the Project

Activity 7: Provision of feedback on relevant non-technical deliverables produced by the external provider contracted by DG Reform, in particular in the definition of the strategic roadmaps for the implementation of both the redesigned DDDM, and prevention (risk mapping and disaster loss data collection) processes.

Activity 8: Provision of feedback on the relevant work produced by the external provider contracted by DG Reform, as well as attendance and active participation in the co-creation and envisioning workshops organised by the external contractor sourced by DG REFORM.

Output 3: Provision of capacity building, engagement and awareness sessions, in support of implementation of the redesigned risk mapping and disaster loss collection process and DDDM process, and provision a recommendation document on the aforementioned activities.

Activity 9: Organisation of events for the cross-governmental dissemination of relevant larger reform project results to the Estonian government and the OECD's recommendations for the implementation of the redesigned DDDM framework (including in crisis management) within the Project timeframe.

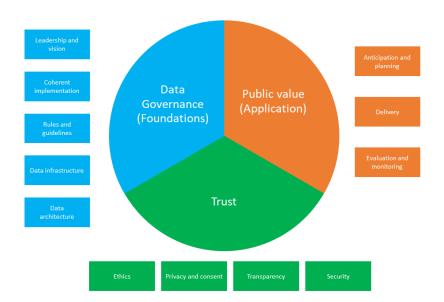

Activity 10: Support the required coordination with other providers of the larger reform project (e.g. private sector companies) and with the Estonian government, when required. To ensure the sound implementation of the OECD activities listed above, the OECD will participate in discussions and coordinate its work, as it deems appropriate and relevant, with the work of the private sector company contracted by DG REFORM and with the Estonian authorities, during the timeframe of the this Project, in order to avoid duplication of efforts and secure the coherence of the work to be carry-out by the OECD and the private sector company contracted by DG REFORM .

Source: Based on TSI Project 21EE02's Detailed Project Description

# Outcome 1: Data-driven decision making (DDDM)

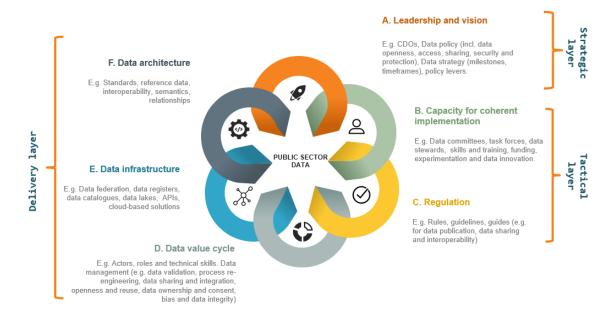

5. This section compiles key OECD observations and recommendations to support the implementation of the DDDM tool in Estonia. These are based on the data and insights collected by the OECD during the meetings organised with key stakeholders from the public sector in the context of the OECD mission to Tallinn, Estonia that took place on 21 - 22 February, 2023.

6. The analysis presented in the following sub-sections is based on the OECD framework for data governance in the public sector (Figure 2), the OECD model for data-driven public sector (Figure 3) (OECD, 2019[1]), and the OECD work on Artificial Intelligence.

#### Figure 2. OECD Model for a data-driven public sector

Source: 2019 OECD Report The Path to Becoming a Data-Driven Public Sector. Available at: <u>https://www.oecd.org/gov/the-path-to-becoming-a-data-driven-public-sector-059814a7-en.htm</u>

#### Figure 3. Data governance in the public sector

Source: 2019 OECD Report The Path to Becoming a Data-Driven Public Sector. Available at: <u>https://www.oecd.org/gov/the-path-to-becoming-a-data-driven-public-sector-059814a7-en.htm</u>

#### Data governance

7. This sub-section assesses the current state of the data governance envinronment framing the DDDM tool. For this purpose, it follows the three main components of the OECD framework for data governance in the public sector (Figure 3) and underlines challenges, opportunities and recommendations that can help to support implementation in the main forward.

8. This section does not explore in detail the regulatory and technical aspects of the DDDM tool as those were covered as part of the deliverables produced by the external contractor. The Government Office is taking additional actions since February 2022 to further assess regulatory challenges and barriers.

#### Strategic layer

Leadership and strategy

Whereas stakeholders acknowledge the relevant of the DDDM tool, co-desiging a roadmap for its implementation would help to increase clarity on the way ahead, including in terms of expectations.

9. In terms of the DDDM tool, the lead role of the Government Office and the supportive role of the National Statistics Office are well acknowledged by stakeholders. Challenges remain nevertheless in relation to the way ahead, timeframes, milestones and roles other stakeholders will play during the

implementation stage. During the OECD mission to Tallinn, stakeholders expressed the lack of clarity from the Government Office in terms of next steps and expectations in terms of the role that stakeholders from the public sector would play in advancing the DDDM tool. This, despite the availability of a draft roadmap developed by the external contractor.

10. While since February 2023 actions have been taken to further engage stakeholders, developing a revised roadmap for the way ahead could help to build up trust in the DDDM tool, its design and implementation, and shed further light for the short-, mid- and long-term. Engaging key stakeholders to codesign the revised version of the roadmap could also help to increase buy in and better align the DDDM tool with other initiatives in place.

> The participation of Statistics Estonia and the Information System Autority (RIA) in both the DDDM tool governance structure and Estonia's National Data Governance Board offers a great opportunity to ensure aligment between the DDDM tool's goals and timeframes with those of Estonia's National Data Strategy. This in order to exploit synergies and avoid duplication of efforts.

11. At a larger scale, there is a need to further fit the DDDM tool in the broader context of Estonia's efforts to advance a data-driven public sector. The Government Office and Statistics Estonia (as owners of the DDDM tool) would need to align ambitions, timeframes and potentially its governance and operational mechanisms with those of broader national data strategies, initiatives and tools either in place or under development. This, including those related to Estonia's National Data Portal and the RIHAKE ( both relevant for the design and implementation of the DDDM tool and its goal to pool data from multiple sources within the public sector).

12. Last, whereas great efforts would be needed at the technical level (e.g. in terms of data cataloguing, standardisation and integration), aligment with relevant available standards and guidelines on data interoperability would require self-assesing if the policy levers at hand are sufficient to enforce compliance with data standards at the data owner level and what organisation would be in charge of enforcing those standards and how.

Risk-management and accountability for the DDDM tool

Aligning the DDDM tool's governance with existing frameworks on Al in public sector, data ethics, AI ethics, personal data protection and with AI oversight mechanisms in the public sector could help to identify and better manage DDDM tool's related risks from the outset. Developing an *ad hoc* risk framework for the use of the DDDM tool with specific practical recommendations would help in this regard.

13. As a system owned by the Government Office and developed with the support of Statistics Estonia and other bodies, the DDDM tool is intended, in a first stage, to support the process of developing the Government Memorandum by tapping on data sources from inside and outside the public sector. Nevertheless, with the long-term vision of building a smart assistant for government's decision-making will

come need for clarity of the distribution of responsibility and accountability. For instance, should the DDDM tool does not respond to system users' expectation and needs, or should the decisions informed by the DDDM tool produce an unintended negative impact on people.

14. Failure to acknowledge and address risks can have an impact on the reliability of the DDDM tool and the decisions its outputs will inform. Taking a risk-mangement approach from the outset could help to better manage risks and avoid negative consequences at all levels – including at the political level. In particular as the system moves towards automation<sup>1</sup>. These concerns were raised by the OECD as part of the feedback provided to the deliverables produced by the external contractor (see Output 2).

15. Potential risks are observed at different levels and range from data-specific risks, to others which are more procedural or long-term. These can include but are not limited to:

- **Data holder:** Data is not prepared according to pre-defined standards but fed into the system, semantic interoperability, data does not exist, data is incomplete, data is not granular (when needed), data readiness does not match the needs of the DDDM system, data discoverability and accessibility, and conflicts between data sources (authoritative data, *source of truth*).
- **System user:** For instance, taking the DDDM system's outputs as definitive without putting them into perspective or bringing sectoral expertise to make better decisions; data selection being incomplete or biased; lack of data governance and transparency over data sources; data provenance.
- **System owner:** In the short term, explanibility will play a key role in building confidence in the DDDM system. For instance, in terms of ensuring any Government decisions (Memorandums) backed up or informed using outputs from the DDDM system are properly identifiable, transparent and auditable. In the long term, as explored by the OECD in the context with AI Generative tools (Lorenz, 2023<sub>[2]</sub>) and as the DDDM system matures and moves toward automation, power distribution (e.g. increasingly delegating decision-making to a future AI-powered DDDM tool), could potentially blur accountability and responsibility. At the same time, managing risks of a potential automated DDDM tool will require opening its algorithms for public audit.

16. Risks at the data holder and system user level can be addressed through investments on data management skills and training courses and supported by the development of guidelines for the use of the DDDM system. Yet, advancing towards more mature stages of data-driven decision making in Estonia would require investing greater efforts to explore and manage current and potential future risks of the tool not only from a data governance but also from an AI governance perspective. Approaching the DDDM tool from a AI and data governance point of view was stressed as part of the feedback provided by the OECD to the deliverables produced by the external contractor.

Estonia's mechanisms for AI and data governance in the public sector should frame the design and implementation of the DDDM tool. But taking a forward -looking approach to risk management could help to built a more reliable and trustworthy DDDM system from the outset.

17. A forward-looking approach could also include interpreting and embedding the implications of Generative AI in the further conceptualisation and implementation of the DDDM system. Whereas exploring the development and use of Generative AI in government is still new and under development

6 |

<sup>&</sup>lt;sup>1</sup> See for instance the case of the Australia's Robodebt and the Netherland's *toeslagenaffaire*.

across OECD countries, the Government Office could learn from instance from some available cases, including:

- Australia: Interim guidance for agencies on government use of generative Artificial Intelligence platforms and Australia's Ombudsman <u>Automated Decision-making's Better Practice Guide</u>.
- Canada: Directive on Automated Decision-Making and Guide on the use of Generative AI.
- **Denmark:** Guidance for responsible use and development of artificial intelligence <u>Use of</u> <u>generative AI in the public sector</u>
- United Kingdom: Guidance to civil servants on use of generative AI GOV.UK (www.gov.uk)

## Showing quick wins and impact in early stages is needed to secure continuous funding and sustainability of the tool.

18. A revised version of the roadmap, co-created with relevant stakeholders, would also need to include milestones with clear benchmarks and timelines for successful delivery. Being the DDDM tool a digital investment, its governance should be framed in the context of the governance arrangements for digital projects in Estonia. This would imply ensuring that decisions on the future of the DDDM tool are informed by available oversight mechanisms to take stock and decide on the way ahead, including potentially putting on hold further investments on the tool.

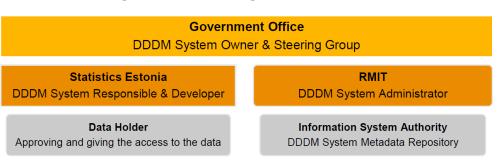

#### Tactical layer

#### Steering and coordination

19. As described in deliverable 1.4 produced by the external contractor, the current governance of the DDDM tool includes a Steering Group chaired by the Government Office (DDDM's System owner). The Steering Group is integrated by representatives from the Government Office, the Ministry of Economic Affairs and Communications (MKM), Statistics Estonia, and the Data Protection Inspectorate.

20. A second governance layer is system-focused and includes also Statistics Estonia and the Information Technology Centre of the Ministry of Finance (RMIT) with key responsibilities in terms of the DDDM tool's development and management. Lastly, a third later (more data-specific) includes the Information System Authority (RIA) (a body within Estonia's MKM) and data holders across public sector bodies.

21. It is worth mentioning that together with Statistics Estonia (as mentioned in previous section), the Information System Autority (RIA) is part of Estonia's National Data Governance Board chaired by the Estonia's Chief Information Officer and the Estonia's Chief Data Officer (roles within MKM).

#### Figure 5. DDDM's tool governance structure

Source: Deliverable 1.4: To-be situation report. As shown in ginal version delivered by PwC to the Government Office.

#### In a later stage, the DDDM governance structure could benefit also from the participation of oversight and auditing bodies and actors, including those from outside the public sector.

22. The participation of the Data Protection Inspectorate in the Steering Group is fundamental to ensure alignment with personal data protection regulations during the design and implementation stages of the DDDM tool. Yet, as the DDDM system evolves, its governance structure could benefit from the participation of other actors in charge of providing independent oversight and monitoring and decisions.

23. Actors such as Supreme Audit Institutions (SAIs) are growinly playing a key role in oversight the use of AI and data in the public sector. For instance, in Norway, the Office of the Auditor General (OAG) is auditing the use of AI in the central government since 2023 as part of its pipeline of new performance audits<sup>2</sup>. Another well-known case is also that of the Netherland's Court of Audit<sup>3</sup>.

24. While these examples illustrate the growing role of SAIs in the auditing of algorithms within the public sector, the inclusion of similar bodies in Estonia as part of the governance of the DDDM tool could also help to make better decisions and manage risks on the way forward, secure real-world practice, and get independent advice, oversight and audit.

Securing a solid network of data stewards will play a key role in ensuring coordination and the coherent implementation of decisions taken by DDDM tool's system owners.

25. At the data holder lever (public bodies), the DDDM tool's governance structure has also identified a a set of roles that should be in place across user organisations (Figure 6). These roles range from those relevant for the management of data (system administrator, data analysts, data source representative, data warehouse developer), to those with more tactical responsibilities (data steward, and "*man of law*").

<sup>&</sup>lt;sup>2</sup> For more information see: <u>Document 2 (2022–2023) (riksrevisjonen.no)</u>

<sup>&</sup>lt;sup>3</sup> For more information see: <u>https://english.rekenkamer.nl/publications/reports/2021/01/26/understanding-algorithms</u>

#### Figure 6. DDDM's tool governance structure: Roles

Role	Description
User	The DDDM user is a public servant who uses the DDDM for data analysis.
Administrator	Administrator sets up all DDDM system components, configures connections to data sources, monitors and resolves issues related to the availability of the DDDM system.
Data Steward	This role is the supervisory or data governance role within an organisation and holds responsibility for ensuring the quality and usability of the DDDM data assets, including metadata. A data steward supports users in understanding data semantics.
Data Source Representative	There must be a data source specialist and representative, a contact person from the data source side who can explain technical details of a particular data source to the DDDM administrator and user.
Data Analyst	Data analyst is a top-level DDDM user who processes data, performs transformations, models data, performs complex data analysis and provides support to other users. The data analyst should also be capable of establishing relationships between data.
Man of Law	A lawyer who drafts legislation for DDDM needs.
Data Warehouse Developer	Data warehouse developer assists the data analyst in conducting complex analyses and develops tools for data processing and analysis. Can be a contracting company.

Source: Deliverable 1.4: To-be situation report. As shown in final version delivered by PwC to the Government Office.

26. Data stewards play a key role in ensuring connection between strategic goals and ambitions and the interpretation of those into key actions within responsible public bodies. In this regard, the capacity of the Government Office to establish a network of data stewards across different organisations (in particular, those controlling key datasets relevant for the functioning of the DDDM system) will have a great impact in securing coordination among public bodies.

27. In doing this, the Government Office would benefit from:

- Clearly defining the roles and responsibilities of data stewards, in the context of the DDDM tool, to secure clarity of responsibilities and avoid duplication of tasks with other existing roles.
- Coordinating with the Ministry of Economic Affairs and Communications (MKM) to align these
  efforts to other initiatives which might have similar objectives to tap on synergies.

#### As implementation of the DDDM tool moves forward, roles such as Data Protection Officers will play a key role to ensure trust in the system.

28. Evidence collected during the OECD mission to Tallinn pointed out to the fact that the availability of formal Data Protection Officer positions across public bodies is still under development. Whereas in Esotnia the coordination of data protection efforts seem to greatly rely on social connections built among public officials across different bodies over time, advancing efforts to formalise the availability of these roles (in line with European regulation) would greatly contribute to increase trust in the DDDM system. This, by helping to clarify to whom DDDM system's user or data owners can reack to ask specific questions related to granting access and sharing personal data.

#### Box .2. Data stewardship in the public sector

29. The OECD has been working with OECD member countries in advancing data steward roles in the public sector. Figure X presents a matrix integrating a list of data-related tasks and their distribution/attribution across data-related roles currently in place in most OECD countries. Neither the tasks and roles are comprehensive and therefore may vary in terms of their application, attribution, definition and practice based on national contexts. This description is based on the Responsible, Accountable, Consulted, and Informed (RACI) Model and the OECD model for data governance in the public sector (OECD, 2019<sub>[1]</sub>). The purpose of this matrix is to further clarify where the Data Steward role at the organisational level fits into the broader data governance ecosystem in the public sector.

#### Figure 6. Main data-related tasks and roles in the public sector

	(Personal) data protection	(I)	(I)	(C)	(C)	(A)	(C)	(C)	(R)	(R)	(R)	(R)
Delivery	Makes <b>first-hand</b> decisions on data access and sharing	(I)	(I)	(C)	(C)	(C)	(C)	(C)	(R)	(R)	(C)	(C)
	Opening data up	(I)	(I)	(C)	(C)	(C)	(A)	(C)	(R)	(R)	(R)	(C)
	Digital and data security	(I)	(I)	(C)	(C)	(C)	(C)	(A)	(R)	(R)	(R)	(R)

Note: (1) 'Data holders' refer to organisations or individuals who, according to applicable laws or regulations, are competent to decide on granting access to or sharing data under their control, regardless of whether or not such data are managed by that organisation or individual or by an agent on their behalf. Source: <a href="https://legalinstruments.oecd.org/en/instruments/OECD-LEGAL-0463">https://legalinstruments.oecd.org/en/instruments/OECD-LEGAL-0463</a>; (2) The data leadership task and the roles of CDO or whole whole-of governments data stewards could be attributed to a specific role or a specific body within the public sector; (3) Accountability and responsibility would fall into bodies or branches in charge of these tasks e.g. regulators, parliaments, etc. (4) Data management, includes creating, collecting, storing, curating, enriching, deleting, providing access to, and sharing data, as well as using data and managing the associated risk. Source: <a href="https://legalinstruments.oecd.org/en/instruments/OECD-LEGAL-0463">https://legalinstruments.oecd.org/en/instruments/OECD-LEGAL-0463</a>; (5) Data audits can take place at a higher level and be performed by organisations such as Supreme Audit Institutions (SAIs) in the context of other exercises, including algorithm accountability mechanisms; (6) RACI (R) Responsible: In charge of implementing the task, (A) Accountable: Ensures the task is performed and finalised, (C) Consulted: Participates in decisions relevant to the implementation of the task, (I) Informed: Official is aware of the task.

Source: Author. Content under-development. OECD (forthcoming), An analysis of National Data Strategies across OECD countries. Not for public sharing and access

#### Hard skills vs. sectoral expertise

Initiatives to support data holders to better manage and prepare the data that will be fed into the DDDM tool can be connected to other ongoing initiatives implemented by other bodies (e.g. the National Competence Centre, e-courses). Yet, training on hard-data skills can't replace the need for multi-sectoral expertise on the issue for analysis. 12 |

30. The importance of building greater data literacy and hard data skills (data analysis, preparation, quality) across public bodies is clear for most public officials interviewed during the OECD mission to Tallinn. These needs were already described as part of the roadmap included in Deliverable 1.5 produced by the external contractor. At the same time, providing training on the use of the DDDM itself and safe testing environments will play a key role in increasing use and confidence in the tool as it evolves and matures.

31. However, some procedural factors play an important role henceforth:

- Public officials' skills and ability to understand and make sence the outputs delivered by the DDDM tool and its underlying data. This would be greatly dependent of sectoral expertise on a given topic, but also on the transparency mechanisms in place to get beyond aggregated data.
- Communicating in clear ways that the outputs of the DDDM tool are are only an input in the process of developing the Government Memorandum, but these do no intend to replace sectoral and contextual knowledge and *know-how*.

It will be fundamental to ensure that the DDDM reflects in its design the need for multi-sectoral expertise, which might be outside the area of knowledge of the direct system user. Different views over a common topic translate into different data needs, sources and holders.

32. By default, public officials involved in the process of developing the Memorandum have already knowledge on their own sector policy issues. The process (as widely described in the deliverables produced by the external contractor) include weekly meetings with the Government Office to discuss on specific topics that need attention, agreements on issues that might require further exploration by analysts and sectoral experts, etc. In this context, views from different Ministries or bodies with a say on one single topic is collected in order to ensure different views and sectoral expertise are brought into the decision making process. This so that the policy issue ca be analysed from different perspectives.

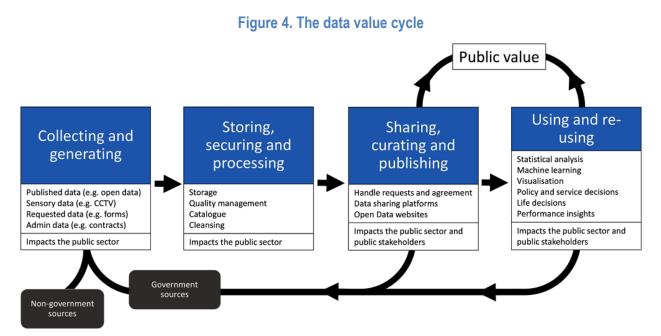

33. Whereas one the goals of the current DDDM tool is to simplify the process of developing a Memorandum, there are critical milestones in this process that should be reflected in the tool itself. For instance, the possibility for different analysts and/or sectoral experts from different ministries to co-create directly on the platform the Memorandum, participate in the data selection process that will inform the outputs of the DDDM tool, or even being notified when a dataset they are responsible for has been selected or requested.

34. Ensuring that that multi-sectoral expertise is always brought in to the decision making process will remain a critical component of the way ahead to help the system deliver comprendensive and well-informed outputs.

#### Delivery layer

35. Deliverables 1.5 (Roadmap) and 1.6 (Proof of concept) developed by the external contractor explored in detail technical challenges related to the design of the DDDM tool.

36. In line with the feedback provided by the OECD to these deliverables, and the data value cycle (Figure 4), briefly introduces some of the key challenges that require attention when developing dataintensive systems. Some of these aspects were highlighted by stakeholders during the OECD mission to Tallinn as key issues to be addressed in the context of the DDDM system.

Source: 2019 OECD Report The Path to Becoming a Data-Driven Public Sector. Available at: <u>https://www.oecd.org/gov/the-path-to-becoming-a-data-driven-public-sector-059814a7-en.htm</u>

	Tactical aspect (System owner or else if already available)	Technical aspect (Data holder)	Mainly relevant for: Data interoperability
